Neonatal Abstinence Syndrome: A Multifaceted Approach to Infant/Family Care

Jodi Jackson, MD*
Betsy Knappen, MSN, APRN**

*Chair Kansas Perinatal Quality Collaborative (KPQC)
Medical Director NICU, Shawnee Mission Medical Center (SMMC)
Neonatologist, Children’s Mercy Hospital and Clinics (CMH)
Associate Professor of Pediatrics
University of Missouri-Kansas City School of Medicine

**Neonatal Abstinence Program Coordinator SMMC
Neonatal Nurse Practitioner SMMC and CMH

Disclosure

- We have no relevant financial relationships with the manufacturers(s) of any commercial products(s) and/or provider of commercial services discussed in this CME activity

- We do not intend to discuss an unapproved/investigative use of a commercial product/device in my presentation.
What is NAS?

- Infants born to mothers taking some medications during pregnancy may develop symptoms after delivery upon cessation of exposure.
- These symptoms (neurological, gastrointestinal, respiratory) are a complex known as Neonatal Abstinence Syndrome (NAS).
- Neonatal withdrawal symptoms have been noted to occur following prenatal exposure to several drug classes:
  - Opioids
  - Benzodiazepines
  - Mood-stabilizing medications
  - Selective serotonin reuptake inhibitors
  - Nicotine

A schematic illustration of the mechanism of opioid withdrawal in neonates.

Prabhakar Kocherlakota Pediatrics 2014;134:e547-e561

©2014 by American Academy of Pediatrics
Commentary on Reporting

▪ Babies should not be stigmatized as “addicts”
  – behavioral and compulsivity components do not apply
▪ They should be considered to be “drug-exposed”
▪ The phenomena of “tolerance” and “withdrawal” are normal physiologic responses to drug exposure and drug discontinuation

Slide adapted from Mark L. Hudak, MD
Improving Outcomes for Substance-Exposed Infants and Families
A Kansas Plan for Prevention and Intervention
Is NAS a Real Problem?

- Increase in the prevalence of NAS; varies by state and study
  - 1.2 - 5.9 per 1000 hospital births; 2000-2012
    - Patrick, SW et al. J Perinatol 2015; 35:350-355
  - 7 - 27 per 1000 NICU admissions; 2004-2013
- Local; 16 /1000 NICU admits, 2/1000 births; 80% increase over 5 years
- National Average LOS for NAS requiring tx ~ 19 days

A. Annualized Neonatal Intensive Care Unit (NICU) Admission Rates for Neonatal Abstinence Syndrome

B. Median Length of Stay, According to Year. I bars in represent interquartile ranges
Increased Prevalence of Opioid Abuse Parallels Increased Incidence of NAS

- Illegal drugs
- Prescription drugs
- Populations merge
  - People can illegally acquire prescription drugs
  - Start with prescription drugs and devolve to illegal drugs
  - Start with illegal drugs, and evolve to programs using prescription drugs
    - Methadone
    - Subutex/Suboxone (Buprenorphine)

Abuse of Prescription Drugs

- Prescription drugs of abuse
  - Opioids
  - Stimulants
  - Central nervous system (CNS) depressants
- Factors contributing to severity of prescription drug crisis
  - Drastic increase in the number of prescriptions written
  - Greater social acceptability for using medications
  - Aggressive marketing by pharmaceutical companies
With efforts to quantify (confounded by charting) it seems that in Kansas some rural areas have a greater incidence than some urban; incidence per 1000 births, rural 0.2-3.1, urban 2.4-2.8

Opioid Prescription Dispensed by US Retail Pharmacies

How to Support Babies

- Not all babies exposed in utero will have NAS
- Caregiver education is essential, all members of team
  - Consistent care
  - Consistent scoring
- NAS can be treated with “Comfort Measures” alone
- When needed pharmacological tx goal: symptom relief
  - Weight gain
  - Avoid seizures
  - Sleep

An Initiative to Improve the Quality of Care of Infants With Neonatal Abstinence Syndrome

Simplified Assessment of Infants
“We discontinued use of FNASS scores to guide pharmacologic management on the inpatient unit (FNASS was still used in the WBN and NICU). Instead, we developed and used our own functional assessment focused on 3 simple parameters: the infant’s ability to eat, to sleep, and to be consoled. If the infant was able to breastfeed effectively or to take ≥1 oz from a bottle per feed, to sleep undisturbed for ≥1 hour, and, if crying, to be consoled within 10 minutes, then morphine was neither started nor increased regardless of other signs of withdrawal. If the infant did not meet these criteria, staff first attempted to maximize nonpharmacologic interventions; if these attempts were unsuccessful, morphine was initiated or increased”. 
Supporting the Families Supports the Baby

- Family education during the pregnancy
- Collaboration between hospital care team and prenatal outpatient OB team prior to delivery is essential
- Family and provider education regarding non-narcotic treatment of pain before, during and after birth is crucial
- Support of mothers during pregnancy regarding drug rehab, or just a stable environment can be beneficial to both mom and baby, and may result in the best outcome for both
This Amazing Program via VON

This video was created as the first in a series of Virtual Video Visits by the Vermont Oxford Network (VON) for use in an internet-based quality improvement collaborative, iNICQ 2013, focused on neonatal abstinence syndrome.

Highlights From the AAP Clinical Report

1. Consensus protocol for maternal screening for substance abuse and evaluation/management of infants at risk for or with signs of withdrawal.
2. Emphasis on non-pharmacologic support.
5. Optimal threshold score for initiating treatment is unknown.
6. Encouragement of breastfeeding when indicated.
7. Pharmacologic treatment, when needed, with opioids. Absolute indications include seizures, feeding intolerance, dehydration/poor weight gain.
8. Duration of in-hospital observation; outpatient follow-up.

Hudak ML, Tan RC, Committee on Drugs, Committee on Fetus and Newborn. Pediatrics 2012; 129:a540-60
Key Factors in NAS Care

- Standard process for identification, evaluation, treatment and discharge
- NAS Protocol to Guide Consistent Care/ address site of care
- Nursing Education/Universal education and training
- Family Education
- Comfort Care
- Scoring Consistency/Consistent Timing of Scoring
- Consistency in Treatment
  - Breast feeding and Pharmacologic Protocols
- Education regarding non-narcotic methods of pain relief
- Family centered, trauma informed programming for women prior to giving birth, continuing in the post partum
Dear Parent,

Congratulations from Shawnee Mission Medical Center (SMMC). We are committed to giving you and your baby the best care possible. This letter is to help you to know what to expect during your hospital stay. It will help you be prepared to care for your baby.

We know that a baby at risk for Neonatal Abstinence Syndrome (NAS) will have less problems when they are cared for by their family. It is best, for your baby, when you and your family can be here to comfort them. We also know that a quiet environment can help. We would like to keep you and your baby together during the hospital stay. This might be on the Mother/Baby unit or in the Neonatal Intensive Care Unit (NICU). It has been shown that babies need less medical treatment and may go home faster, when their parents provide care and comfort.

After delivery, we will monitor your baby. This is what you can expect:
1. Your baby will stay with you on the Mother/Baby unit.
2. The nurses will begin watching for signs of NAS by using a score system starting at about 4 hours of age.
3. The scoring will be done with a NAS scoring tool. Your baby will be scored every 2 to 4 hours. This will be done around feeding times. We would like you to participate in the scoring with your nurses. Please keep your own log that we will provide.
4. We will monitor your baby for 3 to 5 days. The length will depend on the type of medication used during your pregnancy.
5. If your baby needs medication for NAS, he or she will be transferred to the NICU. The NICU has private patient rooms so you will be able to continue to stay with your baby.
6. Once a baby is placed on medication, it may take at least 2 weeks or more to wean off the medication.

During your baby’s stay, it is best if you and your family provide comfort care to your baby. The staff will be here to help you, but it is best if you are the main caregiver. You can provide this care in the following ways:
- Provide comfort for your baby in a quiet, calm environment
  - Provide "livelier" care for your baby
  - Place baby in a baby bed or crib
  - Keep room dark
  - Keep room quiet
  - Limit visitors
  - Breastfeed, unless you are told to do by a provider for medical reasons
  - If you choose to formula feed, a small volume more often may help

- Preterm deliveries prior to 37 wks gestation: 21 (19%) vs Group 2 3 (13%), Group 3 13 (17%), Group 4 16 (17%), Total 53 (17.6%)
- Neonatal intensive care unit admission: 32 (30%) vs Group 2 5 (22%), Group 3 60 (78%), Group 4 22 (24%), Total 119 (40%)

### Pregnancy outcome

- Rate of NAS: 20 (18.5%) vs Group 2 4 (17.4%), Group 3 54 (70.1%), Group 4 16 (17.2%), Total 94 (31%)
- Rate of relapse: 25 (23.1%) vs Group 2 4 (17.4%), Group 3 57 (74.0%), Group 4 21 (22.5%), Total 107 (36%)
ACOG Committee Statement on Opioid Use/Abuse in Pregnancy

- Early universal screening, referral for treatment of pregnant women with opioid use improve maternal and infant outcomes
- A coordinated multidisciplinary approach without criminal sanctions has the best chance of helping infants and families
- For pregnant women with an opioid use disorder, opioid agonist pharmacotherapy is the recommended therapy and is preferable to medically supervised withdrawal because withdrawal is associated with high relapse rates, which lead to worse outcomes.
- More research is needed to assess the safety (particularly regarding maternal relapse), efficacy, and long-term outcomes of medically supervised withdrawal

ACOG, Aug 2017

Prenatal Substance Abuse: Short- and Long-term Effects on the Exposed Fetus
Marylou Behnke, Vincent C. Smith, COMMITTEE ON SUBSTANCE ABUSE, COMMITTEE ON FETUS AND NEWBORN
Pediatrics Mar 2013, 131 (3) e1009-e1024; DOI: 10.1542/peds.2012-3931

Limitations: Inability to separate socio-economic factors, polydrug usage, genetic factors
Difficulties of studies: Inconclusive results, lack studies, length of studies needed
Discharge and Follow-up for babies who have exhibited signs and symptoms of NAS

- **Neurodevelopmental assessments** to identify motor deficits, cognitive delays, or relative microcephaly
- **Psycho-behavioral assessments** to identify hyperactivity, impulsivity, and attention-deficit in preschool-aged children, as well as school absence, school failure, and other behavioral problems in school-aged children
- **Ophthalmologic assessment** to identify nystagmus, strabismus, refractive errors, and other visual defects
- **Growth and nutritional assessment** to identify failure to thrive and short stature
- **Family support assessments** to exclude continuous maternal substance abuse and child abuse.

Parents need to be educated about sudden infant deaths as well as complications due to perinatal infections. The complexity and challenging nature of the home atmosphere should never be underestimated in these situations. The importance of an optimal home environment for the global development of these children should be emphasized to all parents.
